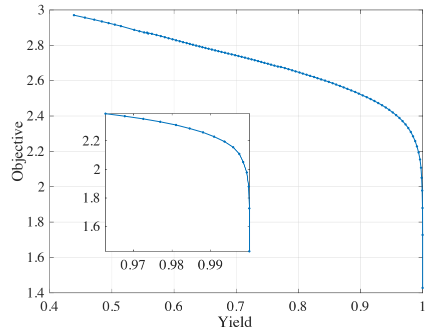
PoBO: A Polynomial Bounding Method for Chance-Constrained Yield-Aware Optimization of Photonic ICs

Zichang He and Zheng Zhang

What limits the standard yield optimization?

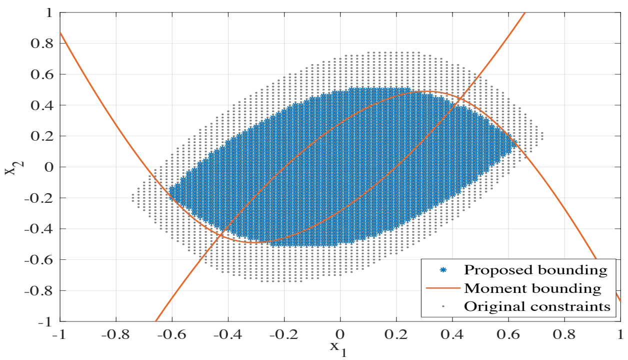


Only yield-driven
↓
Over-conservative design

Chance-constrained yield-aware optimization

$$\max_{\mathbf{x}\in\mathbf{X}} \quad \mathbb{E}_{\boldsymbol{\xi}}[f(\mathbf{x},\boldsymbol{\xi})]$$
$$\text{s.t.} \quad \mathbb{P}_{\boldsymbol{\xi}}(y_i(\mathbf{x},\boldsymbol{\xi}) \le u_i) \ge 1-\epsilon_i, \forall i=[n].$$

Optimizing the design metric while certifying the guarantee on probabilistic yield constraints



Two key components:

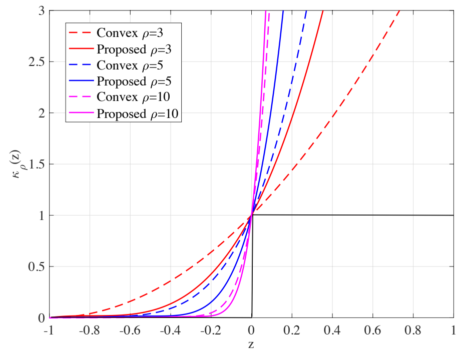
- Performance modeling
- Tractable stochastic programming algorithm

Our PoBO solution

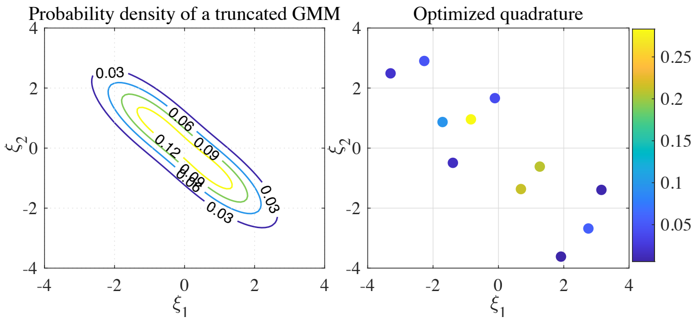
❖ An optimal polynomial kinship function to upper bound the probabilistic constraints

$$\mathbb{P}_{\boldsymbol{\xi}}(y_i(\mathbf{x},\boldsymbol{\xi}) > u_i) \le \int_{\Xi} \kappa_\rho(y_i(\mathbf{x},\boldsymbol{\xi}) - u_i)\mu(\boldsymbol{\xi})d\boldsymbol{\xi} \le \epsilon_i$$

$\kappa(\cdot)$ solved by semi-definite programming, aiming to make the upper bound tight



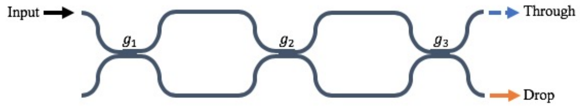
❖ Efficient numerical implementation



Numerical integration by quadrature points, free-lunch from performance modeling

❖ Globally optimal design via polynomial optimization solver

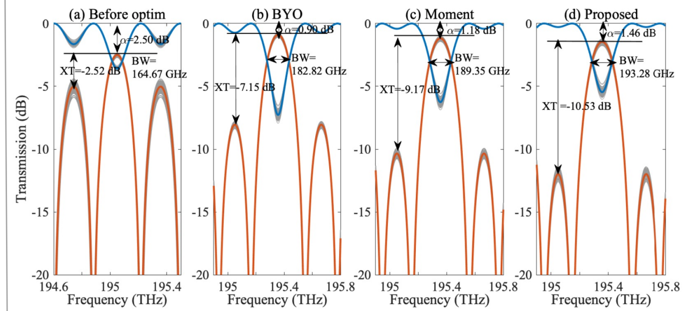
Case study on Mach-Zehnder interferometer



Design task:

$$\max_{\mathbf{x}\in\mathbf{X}} \quad \mathbb{E}_{\boldsymbol{\xi}}[\mathrm{BW}(\mathbf{x},\boldsymbol{\xi})]$$
$$\text{s.t.} \quad \mathbb{P}_{\boldsymbol{\xi}}(\mathrm{XT}(\mathbf{x},\boldsymbol{\xi}) \le \mathrm{XT}_0) \ge 1-\epsilon_1,$$
$$\mathbb{P}_{\boldsymbol{\xi}}(\alpha(\mathbf{x},\boldsymbol{\xi}) \le \alpha_0) \ge 1-\epsilon_2.$$

Design performance:



Better performance + smaller constraint gap Δ

Risk ϵ	Method	$\mathbb{E}$[BW]	Δ_1 (%)	Δ_2 (%)	Yield (%)	# Simulation
0.07	Moment [2]	112.64	7.53	7.42	99.9	65
